Integrated honeygate

Honey gate is welded for easier cleaning. It is made of 304 stainless steel, very long-lasting.

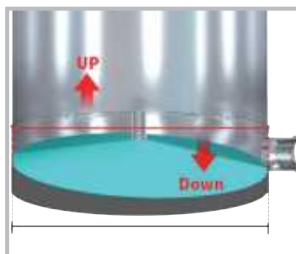

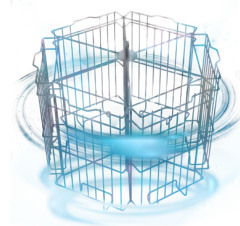

The square plastic pad has a larger contact area and friction with the ground, improving the honey extractor's stability and anti-slip performance.

Electric honey extractor

A touch switch is made. If you accidentally open the lid while the electric honey extractor is in use, it will immediately stop spinning to prevent any possible harm.

While the extractor spins, super strong centrifugal force throws the honey out of honey frame.

The center of the bottom bulges and it slopes down towards honey gate, for which the honey flows out more efficiently. This minimizes the residues inside to avoid waste.

The lifted hinge can flip the cover to the back, making it convenient for beekeepers to take the frame and providing more operational space.

Patent number: 02530320946.5

Traditional bee colony management often faces problems such as bulky equipment, insufficient ventilation, and poor adaptability. To this end, Shenzhen Benefitbee Bee Industry has launched a new generation of bee colony attractor boxes with ten years of technology accumulation, redefining the standard of efficient beekeeping, ensuring ultra-light portability while having all-weather protection functions.

HIVE ENTRANCE

Sliding hive entrance, convenient for beekeepers to use according to their needs.

VENTILATION PORT

Two ventilators with blade design at the front and back provide good ventilation, are durable and easy to clean, and not easy to get wet.

ASSEMBLY INTERFACE

It can be easily assembled in just 10 minutes with stainless steel non-slip screws.

BEE CATCHING METHOD

Add potion or beeswax to attract wild bees to build comb, and obtain a bee colony at a low cost without harming the bees.

Complete Queen Rearing Kit

1. Insert the comb box into a frame and 110 brown cell starter cups are fitted into the back of it.
(With this kit you will be able to raise your own queens and do it without grafting or ever touching a larvae.)
2. Confine the queen in the front of cage and she immediately lays eggs in the 110 available cells.
She can be released in the next day. On the 4th day each newly hatched larvae is ready for transfer.
3. Remove each cell starter cup and insert it into a cell cup holder.
4. Slid this unit onto a cell bar holder which is attached to a cell bar.
5. To finish the cells you now put the cell bar into a cell building colony.
